Pharmacy Manager

For Pharmacy Manager we had to make a project in JavaFX that could pull, edit, and delete data in a database. To start the project we had to make multiple pages for the JFX part. The first page was the home page to list how many customers there are, how much medicine they have, and how much total money they made. After that there was the add medicine page in which you could add medicine to the database, it also lets you update medicine as well as delete medicine.

My biggest struggle with this was figuring out how to make the database delete and update medicine based on the data available. I also had the struggle with space issues on the pharmacy home page itself. The login page was the easiest in my opinion as all it required was a few boxes and an if statement or 2 to get the data. My biggest lesson learned from this project was how to do styling in JavaFX using css.
